**Abstract**

*A growing number of students are now opting for online classes. In this age of technological advancement, educational institutions can now provide effective classroom teaching via online. This shift in the pedagogical medium is forcing academic institutions to rethink how they want to deliver their course content. A survey was conducted from 2<sup>nd</sup> December to 10<sup>th</sup> December 2022 to gather the opinion of the student learners. A Structured Questionnaire link was sent to the students via WhatsApp and Email using Google Form and the number of responses arrived is 80 and is considered as sample. The researcher has applied statistical tools like reliability test, ANOVA and factor analysis to interpret the results. Twenty statements were evaluated for analysis and the result shows that feasibility issues are the major concern for the students at large. The best way to combat this issue is to find the feasibility of learning in advance. Sending timely emails and recorded versions of videos and audio will help the students to patch up the gap.*

**Keywords:** Content, Connectivity, Feasibility, Issues, Networking

**I. INTRODUCTION**

Online learning is considerable development in education, where the mode of instruction has changed from teacher-centred to student-centred [2]. The controversy surrounding the importance of using technologies in educational activities and the usefulness of this approach to education in improving knowledge among students has been the subject of wide debate [1]. Various services like video conferencing and distance learning) are used to ensure communication between teachers and students. Online classes provide opportunities for social interaction among students in many countries and facilitate continuity of education for all through distance learning.
